

Admin View : Debug

**Navigation Bar : Groups & Folders**

- Not used or Hidden in CRM view

**Navigation Bar : Filters**

- Not used or Hidden in CRM view

**Navigation Bar: Client/Debug Account Nav**

- Should function and look and operate like Groups Folders to show a clist of accounts in two folders for the respective types of accounts that would match to this.
- Have apporartite filter (not idea what they would be yet)

**Tool Bar: Admin View Toggle**

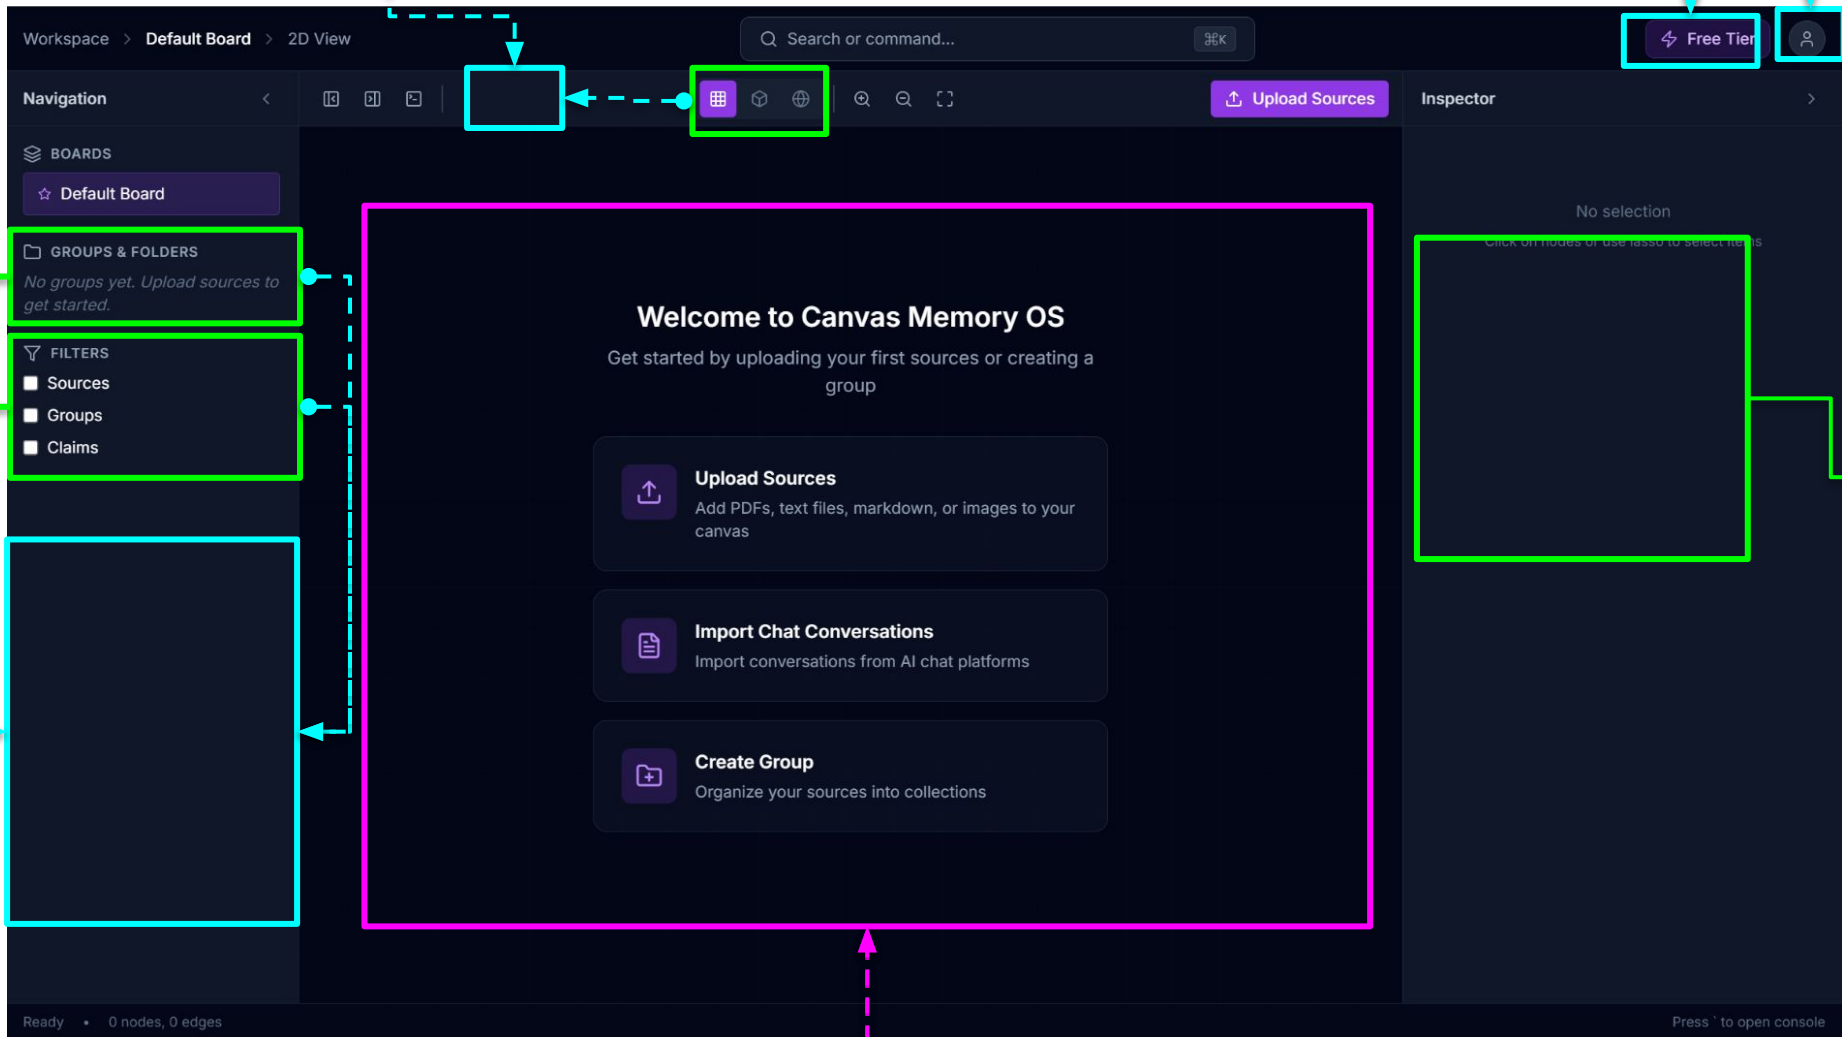

- Switches between debug / client view and 'CRM' view
- Should look something like highlighted UI connected
- Changing this should then change what is shown in the canvas area and the information in Inspector Bar. and Navigation bar

**Header: Membership**

- Shows Account 'membership'
- For Admin Accounts in debug mode on tap get a drop down to switch

**Header: User Menu**

- Settings
- Logout

**Inspector Bar :**  
SShould behave the same as client mode, here selecting from the nav bar will too show the available individual documents in a list and a way to examde that item to see the full thing.

NOTE :we could consider a record view for the Canvas as well. Or to make the inspector view conver the cavas view ( i like this option more i think)

**Canvas: Dashboard**

- Basic Cards and UI to show Any and all data that we can pull here about the system or DB or anything really. Here we want to consolidate any and all numerics and analytics we can find at this point

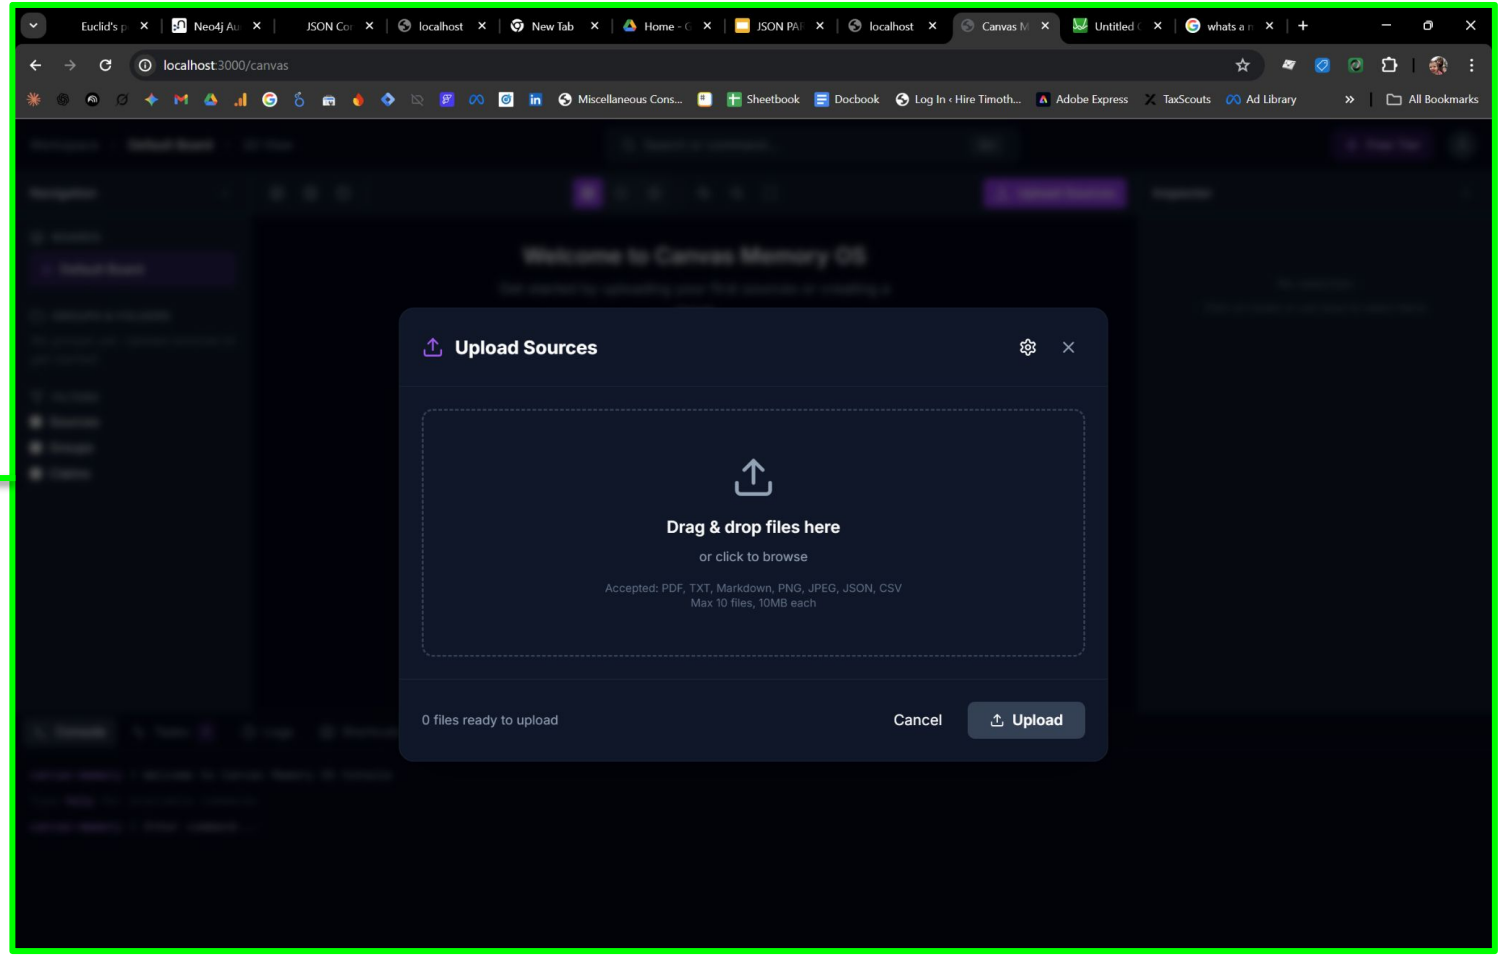

**Canvas: Settings (Not Visible)**

- Basic Cards and UI to show for anything that can be customized or changed. Any setting or parameter. Take for example the default min characters in the upload form. But also the background colors, dark and white theme colors. Any style or thing that is set in one or many places should be here. (ideally with) need to consider how we push and deploy these changes on the users level or the account level for admin  
NOTE THIS IS TRUE FOR CLIENT ACCOUNTS TOO...MORE OR LESS.
- In this mode the Navitigation bar then should show the tree of menus they could have through.
- The Inspector bar will show information and details or example UI changes
  - Maybe even stores the list of pending changes before application.

# Upload Modal Views

## Upload View

- Should work and look like any other nested drop down file naviations.

**Step 1**  
User Uploads data.

**Step 2**  
Checks files type and structure for processing.

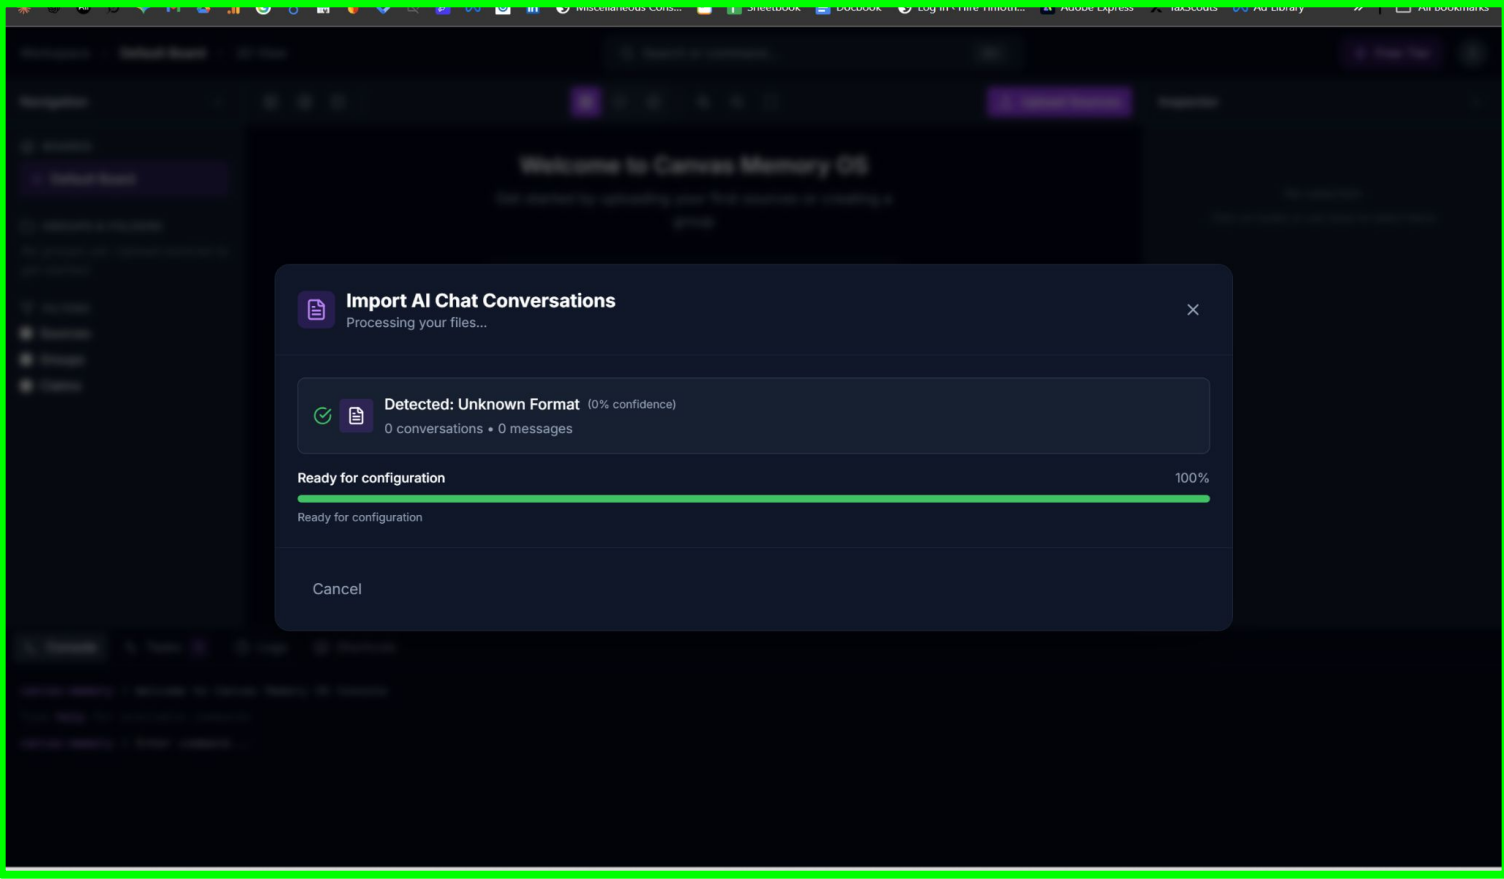

IF does any file queued contains many sources (in this case right now JSON only will extend this later other file types)

Core idea though is the user might upload many sources in many files or just one the AI Chat JSON parsing is the starting framework to take in many sources at once form structured data. But either way they many upload many documents at once.... And either way we need to configure the system on how you want to to process the sources ... still not sure how to best generilze it.

So then either way they need to say if they want to process all context of the source or just some of it, so they set some boundary. Boundaries are defined by the data structured. So in the case of the chat json we have all the basic text structure (space breaks, period breaks, line breaks, section breaks) what we want to be looking for is the the document structure breaks, on top of that. So the user defines the boundaries for reading any text lengths (ie like how we don't look at user messages under a certain length). But then need to define where document breaks are to treat one doc like multiples source or not, for this we use the structured data breaks, treat all files as one new source or as many sources (ie how we separate user and AI chats and code and if we want them as separate files for not)

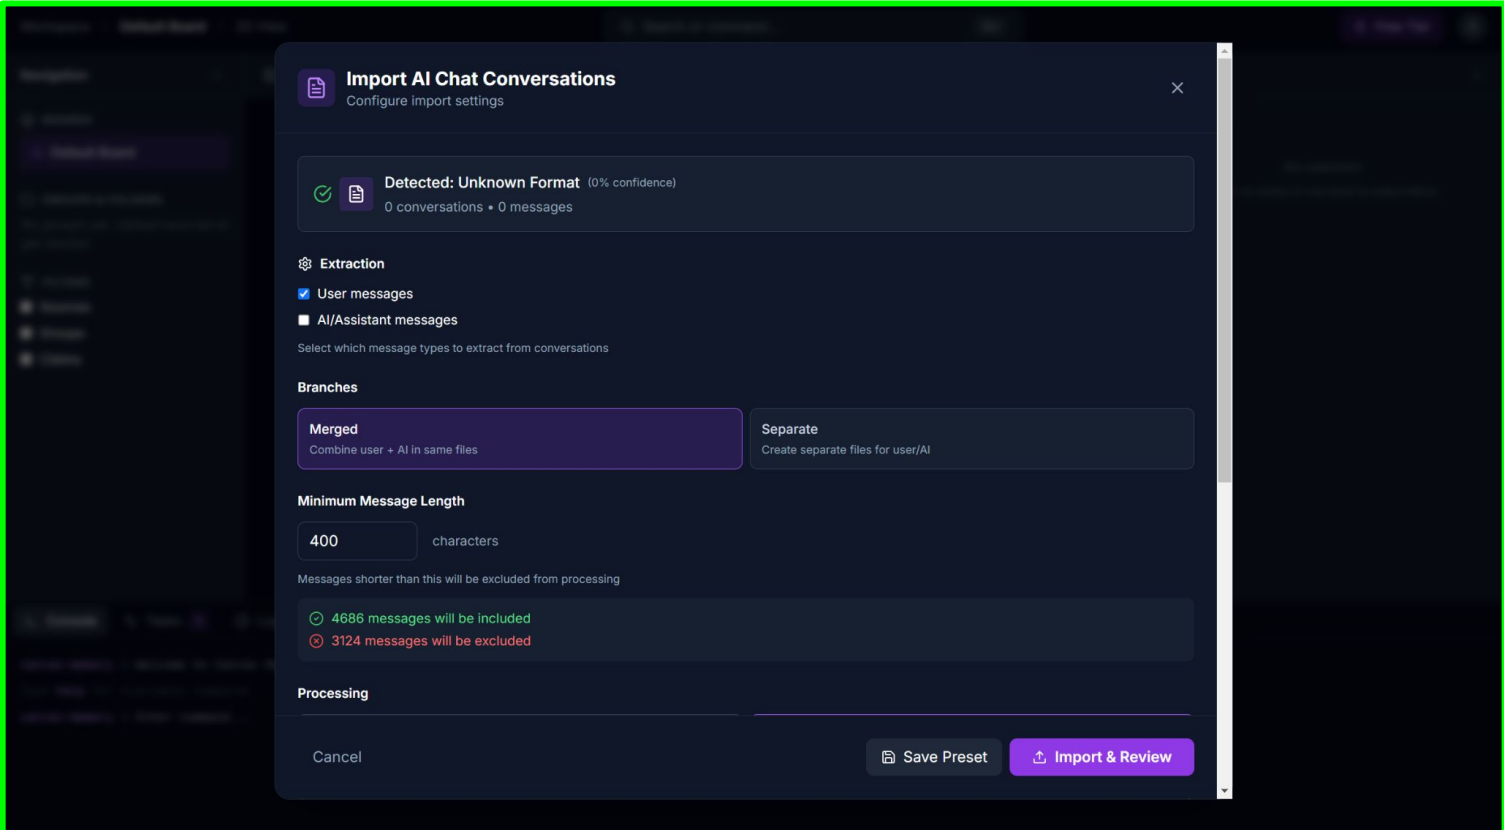

## Processing View

- Should work and look like any other nested drop down file naviations.

## Configuration view

- Note that changing the minimum word count does not change these output and i think the order of This view and the processing view should be switched. So you configure what files are thre before doing any processing then it give you a confirmation af

Import AI Chat Conversations

Configure import settings

Detected: Unknown Format (0% confidence)

0 conversations • 0 messages

Extraction

☒ User messages

☐ AI/Assistant messages

Select which message types to extract from conversations

Branches

Merged

Combine user + AI in same files

Separate

Create separate files for user/AI

Minimum Message Length

400

characters

Messages shorter than this will be excluded from processing

4686 messages will be included

3124 messages will be excluded

Processing

Automatic

AI-powered grouping (Pro)

Manual

Define groups with keywords

Groups

+ Add Group

Define keyword-based groups. Messages matching keywords will be grouped together.

No groups defined yet

Click "Add Group" to get started

Duplicate Detection

☒ Enable duplicate detection

☒ Detect exact duplicates (hash-based)

Near-duplicate similarity threshold

0.85

(0 = different, 1 = identical)

Messages with similarity above this threshold will be flagged as potential duplicates

☒ Detect duplicates across different conversations

Similarity algorithm

Jaccard (token overlap)

☒ Normalize tokens (lowercase, remove punctuation)

Minimum token overlap count

5

Require at least this many shared tokens to consider as duplicate

Ignore when comparing:

☒ Whitespace differences

☐ Case differences

Review options:

☒ Require manual review before applying changes

☒ Extract code blocks from messages

Minimum code block length

50

characters

Filter by languages (leave empty for all)

e.g., python, javascript, sql

Group code blocks by

☒ <> Programming language

☐ Conversation

☐ Keywords (uses groups above)

☒ Deduplicate identical code blocks globally

Code blocks will use the same duplicate detection settings as messages

Cancel

Save Preset

Import & Review

Letes makes this the style of the branches and processing thing with the large buttons, but in this case both can be selected.

This should only appear if both are selected in 'User' and 'AI' are selected.

Currently this doesn't update when changes are made to the Length. To avoid having to rebuild each time lets just have this be at the top and it should be a review of the total of what was detected.

Then after we hit upload there is a confirmation with what is detected to be approved before the actual upload is complete so that we then do this check actually before confirm the actual upload.

This like 'extraction' section where both can be selected.

So we will create manual groups and/or automatic.

This hides these settings and is functional .

Not sure we need this feature. Leave for now

This is great assuming it works. We need to make sure the 'Keywords' also applies to any generated groups.
